Settlement Review Kit: Product Note

Oct 13, 2026 · @Devesh

Problem

Riya, a persona drawn from public complaints, sells ethnic wear on Instagram. After a festive spike, Razorpay holds **₹3,18,400** of her settlement (figures synthetic).

Razorpay's docs route a held settlement to support. One merchant reported in 2021 requests arriving in rounds. Razorpay's guide advises an indexed evidence pack, but Riya's evidence sits in three phone apps.

Solution

A push opens a case naming each requirement: invoice and delivery proof for 6 payments sampled by risk policy.

- **Invoices:** AI links pages to payments; amounts are checked exactly.
- **Delivery:** Shiprocket records with scoped consent; screenshots marked merchant-supplied.
- **Receipt:** a versioned pack that survives refresh; later items add versions.

The task ends at the receipt; Razorpay decides. **Why mobile:** the evidence is on the phone.

Decisions

- **Risk policy sets the screen.** Unclassified holds show "no documents requested yet" and a date; internally they get an owner.
- **Explain requests, never signals.** Each status is a reviewer's decision per requirement.

Not built: auto-release, chargebacks (Dispute Responder), analyst chat.

Metrics

Primary: share of eligible cases with a response in 24 hours judged sufficient on first review. **Also:** active task time (under 2 min), P90 calendar time, analyst minutes. **Guardrail:** matured fraud loss within a margin set in advance.

Synthetic data. Real: on-device PDF reading and exact checks. Simulated: Shiprocket, decisions.
